(At Site):</b><br>0798110930       |
| <b>Activities Completed:</b> <ul style="list-style-type: none"><li>- Reviewed the REST API requirements and mapped the existing operations to JSON endpoints.</li><li>- Added Jackson JSON serialization with Java date/time support.</li><li>- Created the /api/* servlet routes for authentication and user operations.</li><li>- Added an API authentication filter using the existing session and password-change rules.</li><li>- Added safe response mapping that excludes password hashes and internal security fields.</li><li>- Added one consistent JSON error format and appropriate HTTP status handling.</li><li>- Connected API routes to the existing authentication, directory, password and audit services.</li></ul> |                                            |
| <b>Activities in Progress:</b> <ul style="list-style-type: none"><li>- Completing user and role create/edit/delete endpoints through shared management services.</li><li>- Verifying that REST permission checks and validation match the JSP application.</li><li>- Documenting endpoint bodies, responses and status-code behavior for a future Angular client.</li></ul>                                                                                                                                                                                                                                                                                                                                                            |                                            |
| <b>Issues/Recommendations:</b> <p>The existing application returned complete JSP pages, while Angular will require JSON data. I added a transport-only API layer and explicit response mapping, while keeping authentication, validation and business rules in services rather than copying them into each endpoint.</p>                                                                                                                                                                                                                                                                                                                                                                                                               |                                            |
| <b>Comments:</b> <p>The main REST structure is operational. Authentication, session enforcement, safe JSON mapping and core user endpoints can now support a separate frontend without exposing persistence entities.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                            |
